October 20 - 22, 2021

# Agenda

- Suricata Inspection use cases
- Network appliance challenges
- How Gateway Load Balancer (GWLB) helps
- Top GWLB use cases and how it works
- How to deploy Suricata in-line on ECS using GWLB
- Demo
- Q&A

# Suricata Inspection Use Cases

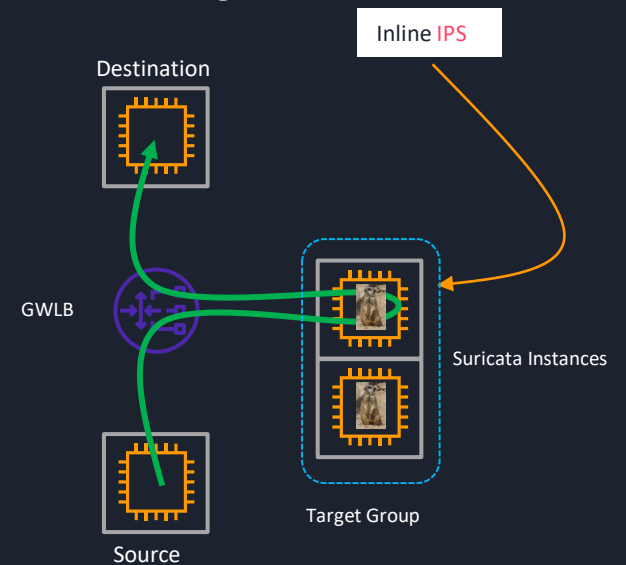

## Out-Of-Band

[AWS Quick Start Guide ->](#)

## Inline

[Deep dive in today's session](#)

# Network Appliances in the cloud

Inserted in-line for  
transparent  
inspection of  
critical traffic

Easy to add but  
challenging to  
manage, scale and  
maintain

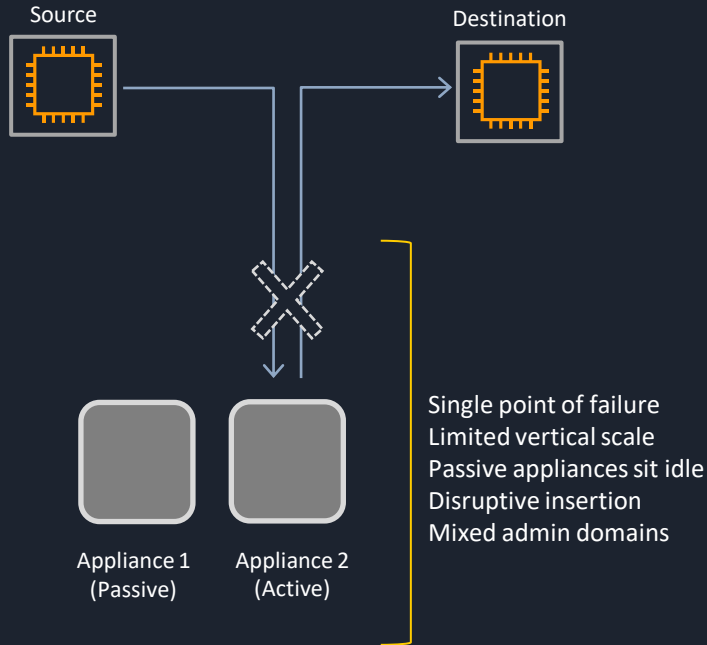

Often required by  
policy, or due to  
expertise and  
investment

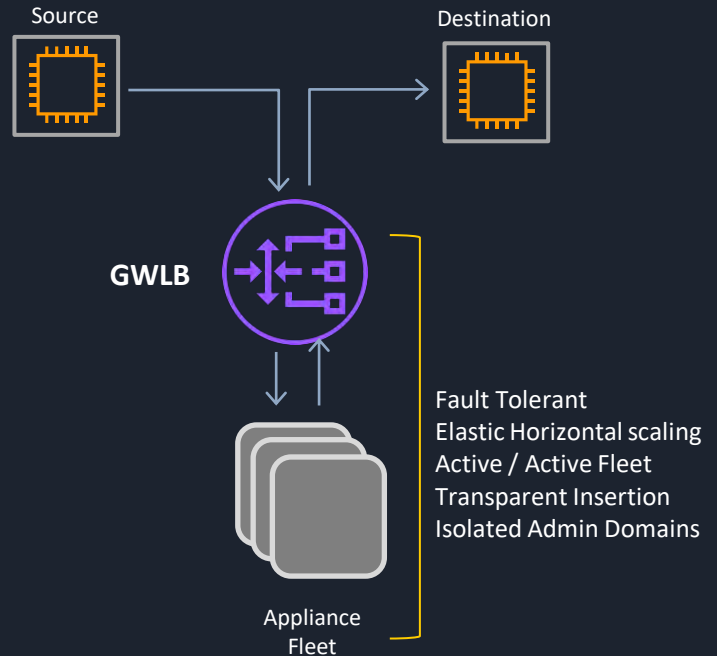

Use the same Network Appliances on AWS and on-premises

# Challenges solved by Gateway Load Balancer

## Before Gateway Load Balancer

## After Gateway Load Balancer

# Gateway Load Balancer Customer Benefits

## Reduce downtime

*Eliminate single points of failure and scale horizontally in an active/active mode*

## Improve Performance

*Remove bottlenecks, reduce latency and increase bandwidth*

## Accelerate Your Cloud Migration

*Leverage existing skillsets, tools, and license agreements*  
*Meet compliance and regulatory requirements*

## Lower Costs

*Eliminate standby appliances, consolidate inspection VPCs and reduce operational overhead*

# Gateway Load Balancer Top Use Cases

## Partner Solutions

Firewalls  
IDS/IPS

Network Visibility  
and Analytics

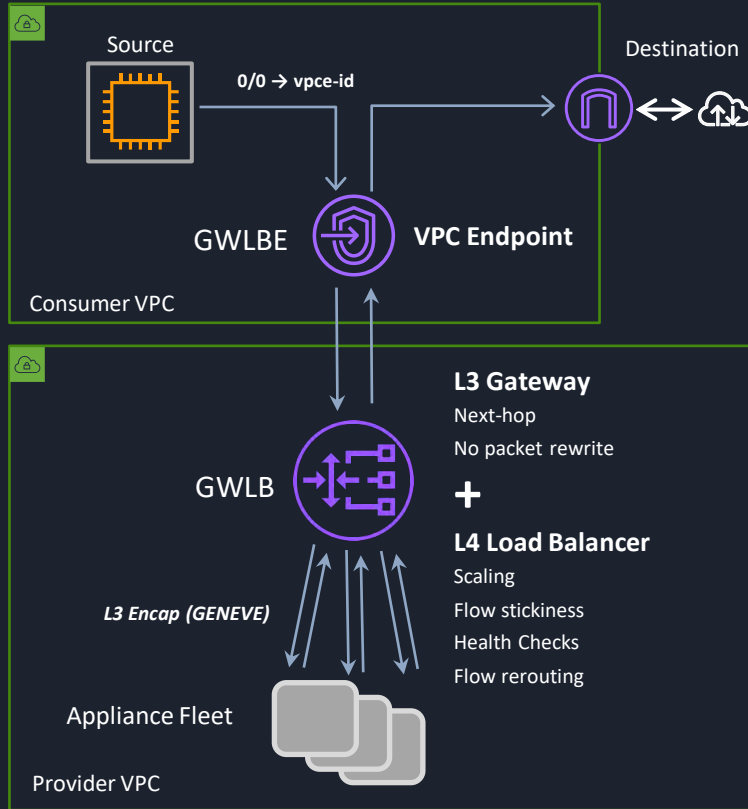

Custom Linux  
Inspection  
Appliances

## DIY

# How it works: GWLB Components

## Components

- Gateway Load Balancer Endpoint (GWLBE) - A new type of VPC endpoint that can be a next-hop in a VPC route table
- Gateway Load Balancer (GWLB) - A new type of load balancer that includes L3 Gateway + L4 Load Balancer capabilities
- Both components powered by AWS Hyperplane

## Deployment

- Create GWLB and appliance fleet using steps similar to NLB
- Send traffic to GWLBE by updating VPC route tables

# Learn & Be Curious

<https://www.aboutamazon.co.uk/working-at-amazon/our-culture/our-leadership-principles>

- Launch of AWS Network Firewall sparked interest in IPs/IDs rule building and capabilities
- Need / Want to help customers by giving them options to build themselves
- Which existing services could be harnessed for use with GWLB mechanics?

- PoC it!

```
Pre Requisites:
• GWLB deployed
• GWLBe deployed

Setup (EC2)

# Elevate permissions
sudo -s

# Add Amazon Linux additional repos
amazon-linux-extras install -y epel

# Update and setup httpd ( this is needed for the ELB health checks )
yum update -y && yum install httpd -y

# Create an Apache landing page and copy to /var/www/html/index.html
echo '<html> <body> <h1>Apache</h1> <p style="color: darkgreen;">[Service OK]</p> </body> </html>' > /var/www/html/index.html

# Start the httpd service and enable it
systemctl start httpd && systemctl enable httpd

# Install the Suricata binaries prereqs
yum -y install gcc libpcap-devel pcre-devel libyaml-devel file-devel \
zlib-devel json-c-devel libcap-ng-devel libnet-devel tar make \
libnetfilter_queue-devel lua-devel PyYAML libmaxminddb-devel rustc cargo \
lz4-devel

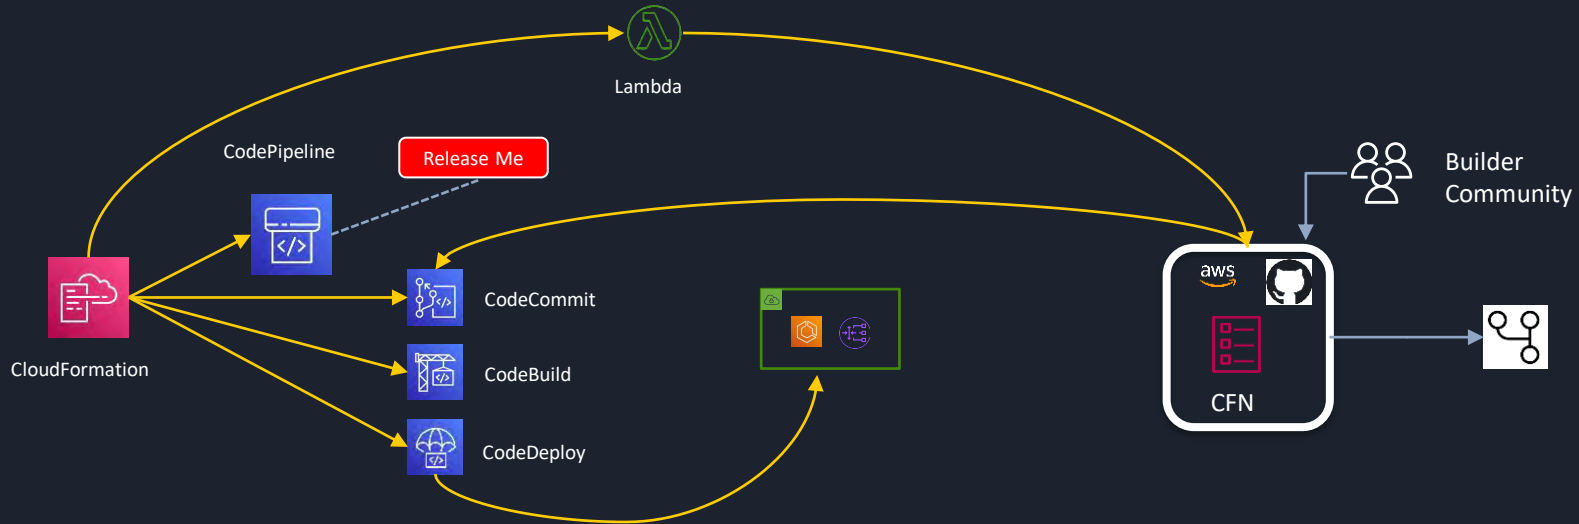

pip3 install pyaml

# Download the 6.x binaries to /tmp and unpack these
wget -P /tmp https://www.openinfosecfoundation.org/download/suricata-6.0.0.tar.gz
```

# Invent and Simplify

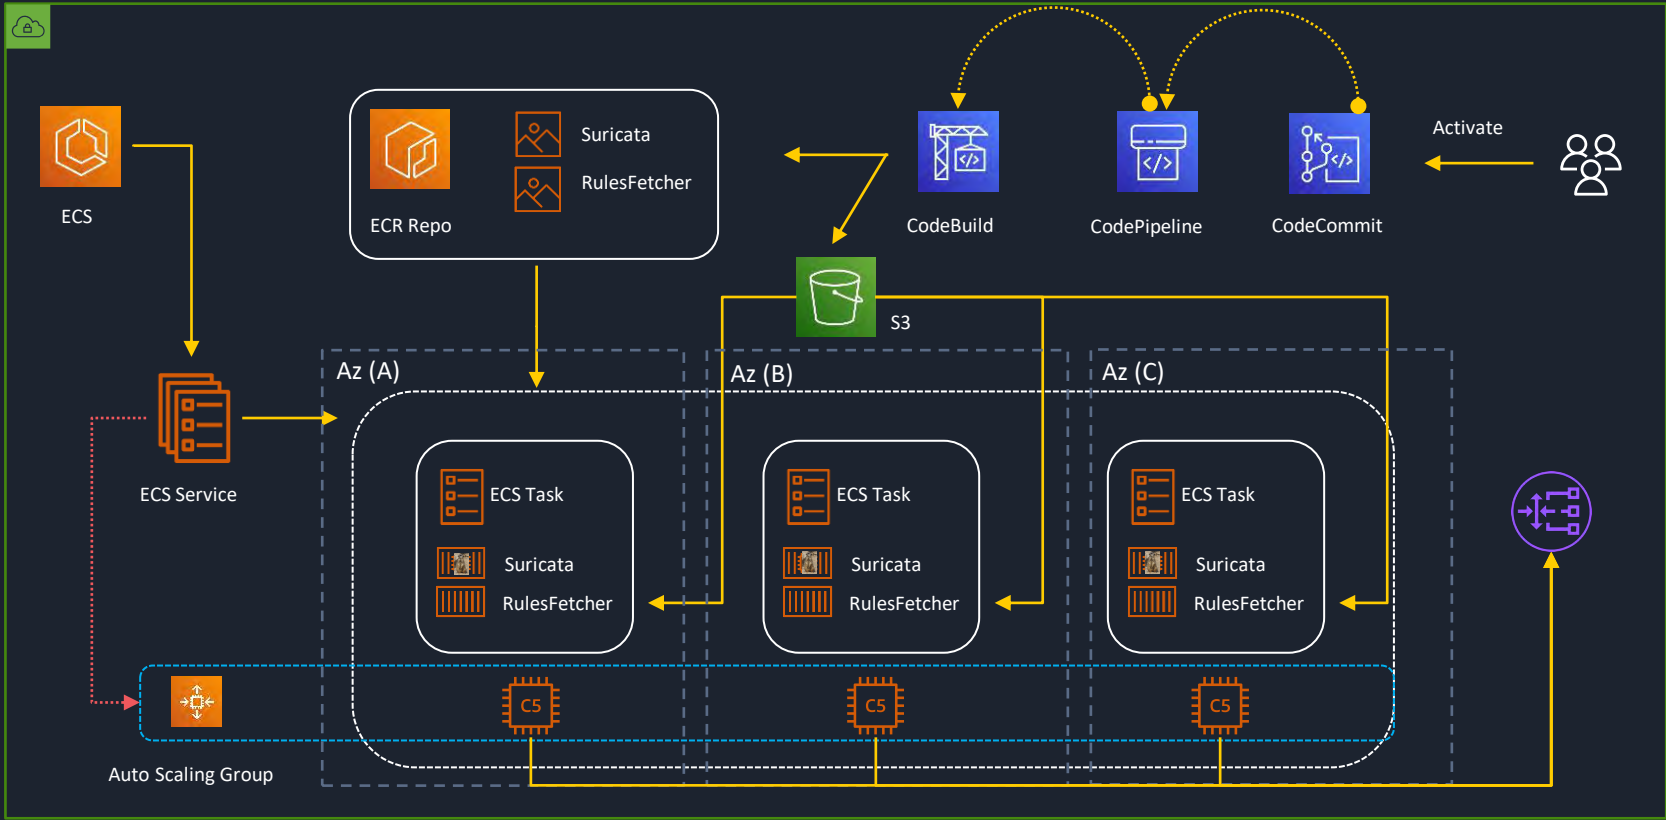

## Infrastructure as code and pipelines

- Code compilation and Image packing - Can this process be improved?
- Could it be made portable?
- Desire to use DevOps processes for code release and auditing
- Customizable and extensible

# Invent and Simplify

## From commits to running code

# Invent and Simplify

## Scaling and Baseline

- Choose a suitable instance with a good network baseline and suitable RAM/CPU allocation
- Use ECS Application Autoscaling and define your Target, Policy and Metric
- Build custom metrics as desired

```
SuricataScalableTarget:  
Type: AWS::ApplicationAutoScaling::ScalableTarget  
Properties:  
  RoleARN: !GetAtt SuricataEcsAutoScalingRole.Arn  
  ResourceId: !Sub service/${SuricataEcsCluster}/${SuricataService.Name}  
  ServiceNamespace: ecs  
  ScalableDimension: ecs:service:DesiredCount  
  MinCapacity: !Ref SuricataClusterMinSize  
  MaxCapacity: !Ref SuricataClusterMaxSize
```

```
AvgCpuScalingPolicy:  
Type: AWS::ApplicationAutoScaling::ScalingPolicy  
Properties:  
  PolicyName: cpu-suricata-tracking-scaling-policy  
  PolicyType: TargetTrackingScaling  
  ScalingTargetId: !Ref SuricataScalableTarget  
  TargetTrackingScalingPolicyConfiguration:  
    DisableScaleIn: false  
    ScaleInCooldown: 300  
    ScaleOutCooldown: 300  
    PredefinedMetricSpecification:  
      PredefinedMetricType: ECSServiceAverageCPUUtilization  
      TargetValue: !Ref SuricataCpuScalingPercentage
```

```
{  
  "Parameters" : {  
    "PcapLogRetentionS3": "5",  
    "DefaultLogRetentionCloudWatch": "3",  
    "EveLogRetentionCloudWatch": "30",  
    "SuricataRulesets": "",  
    "MaxMindApiKey": "",  
    "SuricataInstanceType": "c5n.large",  
    "SuricataClusterMaxSize": "10",  
    "SuricataClusterMinSize": "2",  
    "SuricataCpuScalingPercentage": "80"  
  }  
}
```

# Dive Deep

## Things we learned and built along the way

- ECR Public Repo to the rescue - [public.ecr.aws/amazonlinux/amazonlinux:%](#)
- Docker build steps went Rusty over night - <https://sh.rustup.rs>
- Pcap operations and failing to read the raw Suricata code
- Git driven, rule deployment and engine updates
- Surfacing \*log outputs
- Exposing GeoIP and Lua functions
- Go to the Zoo

# Think Big

## Business networks, blogs and re:Invent

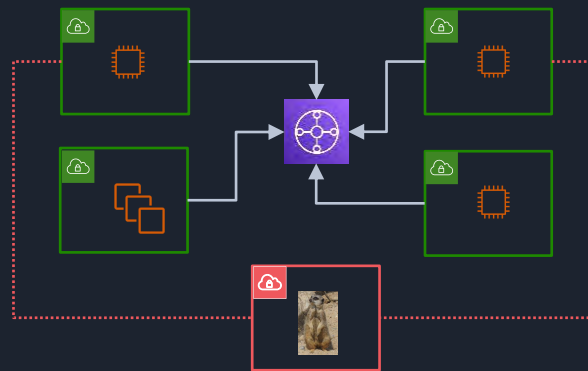

Create a public facing blog
